

SANYO**LC75750E, 75750W****1/3 Duty VFD Driver****Overview**

The LC75750E and LC75750W are 1/3 duty VFD drivers that can be used for electronic tuning frequency display and other applications under the control of a micro-controller. These products can directly drive VFDs with up to 264 segments.

Features

- 264 segment outputs.
- Noise reduction circuits are built into the output drivers.
- Serial data input supports CCB format communication with the system controller.
- Dimmer can be controlled by serial data input.
- High generality since display data is displayed without the intervention of a decoder.
- All segments can be turned off with the $\overline{\text{BLK}}$ pin.

Package Dimensions

unit: mm

3151-QFP100E

unit: mm

3181B-SQFP100

- CCB is a trademark of SANYO ELECTRIC CO., LTD.
- CCB is SANYO's original bus format and all the bus addresses are controlled by SANYO.

■ Any and all SANYO products described or contained herein do not have specifications that can handle applications that require extremely high levels of reliability, such as life-support systems, aircraft's control systems, or other applications whose failure can be reasonably expected to result in serious physical and/or material damage. Consult with your SANYO representative nearest you before using any SANYO products described or contained herein in such applications.

■ SANYO assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO products described or contained herein.

A11060

- When CL is stopped at the high level

A11061

Figure 2

CCB address : Transfer 00100001B (84_H) as shown in Figure 2

DM0 to DM9 : Dimmer data

This data controls the duty of the G1 to G3 digit output pins, and consists of 10 bits with DM0 being the LSB. Note that the intensity of the display can be adjusted by controlling the duty of the G1 to G3 digit output pins.

The relationship between the dimmer data and the dimmer value is as follows.

DM9	DM8	DM7	DM6	DM5	DM4	DM3	DM2	DM1	DM0	Dimmer value (t4/t3)
0	0	0	0	0	0	0	0	0	0	0/1024
0	0	0	0	0	0	0	0	0	1	1/1024
0	0	0	0	0	0	0	0	1	0	2/1024
				⋮						⋮
1	1	1	1	1	1	1	1	0	0	1020/1024
1	1	1	1	1	1	1	1	0	1	1021/1024
1	1	1	1	1	1	1	1	1	0	1022/1024
1	1	1	1	1	1	1	1	1	1	Not used

t3, t4 : See Figure 4.

D1 to D88 : Display data for the G1 digit output pin.

Dn (n = 1 to 88) = 1 : On

Dn (n = 1 to 88) = 0 : Off

D89 to D176 : Display data for the G2 digit output pin.

Dn (n = 89 to 176) = 1 : On

Dn (n = 89 to 176) = 0 : Off

D177 to D264 : Display data for the G3 digit output pin.

Dn (n = 177 to 264) = 1 : On

Dn (n = 177 to 264) = 0 : Off

Correspondence between Display Data (D1 to D264) and Segment Output Pins

S30	D30	D118	D206	S60	D60	D148	D236				

Example : Segment output pin S11 is controlled as follows :

Display data			Segment output pin S11 state
D11	D99	D187	
0	0	0	The segments corresponding to the G1, G2, and G3 digit output pins are off
0	0	1	The segments corresponding to the G3 digit output pin are on
0	1	0	The segments corresponding to the G2 digit output pin are on
0	1	1	The segments corresponding to the G2 and G3 digit output pins are on
1	0	0	The segments corresponding to the G1 digit output pin are on
1	0	1	The segments corresponding to the G1 and G3 digit output pins are on
1	1	0	The segments corresponding to the G1 and G2 digit output pins are on
1	1	1	The segments corresponding to the G1, G2, and G3 digit output pins are on

BLK and the Display Control

Since the IC internal data (D1 to D264 and the control data) is undefined when power is first applied, the display is off (S1 to S88, G1 to G3 = low) by setting the $\overline{\text{BLK}}$ pin low at the same time as power is applied. Then, meaningless display at power on can be prevented by transferring all 336 bits of serial data from the controller and setting $\overline{\text{BLK}}$ pin high after the transfer completes while the display is off. (See Figure 3.)

Power Supply Sequence

The following sequences must be observed when power is turned on and off. (See Figure 3.)

- Power on : Logic block power supply (V_{DD}) on $\rightarrow$ Driver block power supply (V_{FL}) on
- Power off : Driver block power supply (V_{FL}) off $\rightarrow$ Logic block power supply (V_{DD}) off

A11062

Figure 3

Output Waveforms (S1 to S88)

A11063

Relationship between Segment and Digit outputs

A11064

Figure 4

- Consider the examples shown in Figure 4, where display data is set up so that the segment outputs S1 to S88 output V_{SS} level on the G1 and G3 digit output timing and V_{FL} level on the G2 digit output timing. (Here, the G2 side being lighted) The relationship between the time t3 and the oscillator frequency f_{OSC} is $t3 = 2048/f_{OSC}$.
- The digit output G1 to G3 waveforms in Example 1 are output when the dimmer data (DM0 to DM9) are set to 3FEH. The relationship between the time t1 and the oscillator frequency f_{OSC} is $t1 = 2/f_{OSC}$. Note that the time t1 and the time t2 are the same period in Example 1.
- The digit output G1 to G3 waveforms in Example 2 are those when the dimmer data (DM0 to DM9) are set to a smaller value. Although the time t1 does not change, the time t2 becomes longer. When the dimmer data (DM0 to DM9) are set to 1FF_H and the oscillator frequency fosc is 2.4 [MHz], then the time t2 is :

$$t2 = t3 - t1 \times (1FF_H + 1)$$

$$= \frac{1024}{f_{OSC}}$$

$$= 0.43[\text{ms}]$$

- When the dimmer data (DM0 to DM9) are set to an even smaller value, the time t2 becomes even longer, as in example 3. Note that the time t1 does not change here, either.

Sample Application Circuit

A11065

Notes on the segment and digit waveforms

A11066

Figure 5

The segment waveform is distorted by the VFD panel used and the wiring, and furthermore, in the case of being used with essentially no dimming as in the digit waveform 1, as shown in Figure 5, the VFD panel glow dimly. By carefully considering the segment waveform, it can be seen that this problem can be resolved by applying an adequate amount of dimming, as shown in digit waveform 2.

Notes on transferring display data from the controller

Since display data is transferred in three operations as shown in Figure 2, we recommend that all display data be transferred within 30 [ms] to prevent degradation of the visual quality of the displayed image.

- Specifications of any and all SANYO products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.
- SANYO Electric Co., Ltd. strives to supply high-quality high-reliability products. However, any and all semiconductor products fail with some probability. It is possible that these probabilistic failures could give rise to accidents or events that could endanger human lives, that could give rise to smoke or fire, or that could cause damage to other property. When designing equipment, adopt safety measures so that these kinds of accidents or events cannot occur. Such measures include but are not limited to protective circuits and error prevention circuits for safe design, redundant design, and structural design.
- In the event that any or all SANYO products (including technical data, services) described or contained herein are controlled under any of applicable local export control laws and regulations, such products must not be exported without obtaining the export license from the authorities concerned in accordance with the above law.
